We present the first-principles study of the Ag-C60-Ag (103) surface system, which provides new insights into the stability of the metal-semiconductor system. Our results indicate that when deposited on top of C60, Ag adatoms are stable at elevated temperatures. Depending on the coverage and the temperature, we find either a thermally induced metal-to-insulator transition or a finite density of Ag electronic states at the Fermi level. Both transitions are accompanied by abrupt changes in the electronic structure, which include discontinuous changes in the density of states and changes in the number of occupied states at the Fermi level. We present the electronic structure of C60-Ag(103) as a function of the Ag coverage at ambient temperature. Our results provide a new perspective on the stability of the C60-Ag interface.Endoscope-assisted minimally invasive surgery in the treatment of recurrent recurrent and complex skull base chordoma. To evaluate the long-term results of endoscope-assisted minimally invasive surgery for recurrent and complex skull base chordoma. Between November 2005 and April 2009, the authors performed endoscope-assisted minimally invasive surgery in 16 patients with recurrent and complex skull base chordoma and analyzed the results. All patients were followed up with MRI every 3 months postoperatively and the mean follow-up period was 20 months. The operative time, volume of the tumor removed, estimated blood loss, postoperative hospital stay, and postoperative complications were recorded. The mean tumor resection size was 6.5 cm3. All the patients experienced surgical complications. The postoperative complications included cerebro a1d647c40b
